Use	The local controller is used to control the motor of a single roller blind. It is the basic element needed to create a central roller blind control system in the house (with group and central controllers). Electronics used in the local controller allows for "automatic calibration" of the roller shutter - you do not need to hold the button all the time until the roller blind is completely open or closed, the favorite roller blind position - the roller blind will open/close to the programmed position, e.g. when you want to cover the window only partially .
